

Careplan 

VpH Test Glove

Pre-term deliveries occur in as many as 10% of all pregnancies, and their cause can be vaginal infection during pregnancy. Acidity levels are indicative of the vaginal tract's defence against threatening pathogens: a weak natural defence is reflected in an increased pH value.

Helping to lower the occurrence of premature birth

Now, your pregnant patients - from the early stages of pregnancy to the 37th week of gestation – can monitor their pH values with an easy-to-use VpH Test Glove. The Careplan VpH Test Glove allows self-measurement of vaginal pH, which can help;

- Identify those at risk of premature birth
- Prompt early medical intervention
- Lower the rate of prematurity.
